

# Thesis Supervision Meeting Summary

Adrián Fernández-Paniagua Belinchón

March 9, 2026

## Meeting Overview

- **Supervisor:** Christian Damsgaard Jensen
  - **Focus:** Discussion about data transformation with LLM and phishing techniques
- 

## 1. Key Decisions & Technical Shifts

- **LLM Infrastructure:** Moved away from local LLM deployments (e.g., Llama-3-8B) for the profiling stage. We will instead utilize API-based services (**Gemini or ChatGPT**) to process complex unstructured data gathered using several OSINT tools.
- **Methodology:** The system will prioritize the correlation between public digital footprints (LinkedIn, Instagram, GitHub, etc) and specific phishing susceptibility.

## 2. Research Requirements

- **Phishing Taxonomy:** Conduct a deep dive into current phishing strategies and social engineering methods.
- **Academic Foundation:** Source and review recent papers specifically to phishing attacks and its structure.

## 3. Action Items (To-Do List)

- Task 1: Tool Expansion:** Continue gathering and testing OSINT tools for the "Identity Resolution" phase to map a target's attack surface.
- Task 2: Prompt Engineering:** Research and develop "durable" LLM prompts. The goal is to create prompts that can consistently transform raw OSINT data into highly personalized, "fake" phishing emails regardless of model updates.
- Task 3: Literature Update:** Add new sources regarding attack modeling (phishing) to the bibliography.

## 4. Next Meeting

**Date:** March 16, 2026
