

Thesis Supervision Meeting Summary

Adrián Fernández-Paniagua Belinchón

March 30, 2026

Meeting Overview

- **Supervisor:** Christian Damsgaard Jensen
 - **Focus:** Discussion about data transformation with LLMs, OSINT tool expansion, and project infrastructure.
-

1. Current Progress: OSINT & Identity Resolution

- **LinkedIn Scraper Development:** Currently building a custom scraper using a mock account to automate the extraction of professional profiles.
- **deepkrak3n Integration:** Integrating a new tool, deepkrak3n, into the OSINT strategy to automatically gather and map various service accounts linked to a specific name tag.
- **Documentation Strategy:** Agreed to document **all** OSINT tools explored during the research phase, regardless of their final utility. Non-functional or less effective tools will be compiled in a "Toolbox Appendix".

2. Infrastructure & Deployment

- **External Server Migration:** Discussed transitioning the entire project environment to an external server (Linux machine). This will provide the necessary infrastructure to run multiple OSINT tools in parallel and improve overall execution efficiency.

3. Research & Literature Review

- **New Highly Relevant Literature:** Found and discussed a highly relevant recent paper, "*Evaluating large language models' ability to automate spear phishing*". This paper is directly applicable to the thesis, as it evaluates both the offensive and defensive capabilities of LLMs in the phishing domain, demonstrating that AI-automated phishing can reach success rates comparable to human experts.
